Oil, gas and infrastructure spending offer opportunities

By Andy Greatead, CEO

In a recent report, the International Monetary Fund signalled the end of the recession, forecasting that the world economy would grow by 3 percent in 2010. It predicted that Australia's growth in 2010 would be in the region of 2%.

This followed more favourable opinions of the Australian and world economy's future by both international and local organisations, including the Reserve Bank of Australia.

At the same time newspapers have been awash with reports of improved consumer and business confidence.

However, there was one bit of news which above all others was responsible for finally putting an end to the doom and gloom in the country - the announcement that the Gorgon gas project would go ahead.

\$80 billion in resource projects

This followed closely on a report by the Australian Bureau of Agricultural and Resource Economics which revealed that advanced minerals and energy projects to the value of \$80 billion were currently under way in Australia.

This included eight oil and gas projects valued at \$27 billion in Western Australia. No wonder people started talking of WA as the Saudi Arabia of the gas industry.

This massive spending on oil and gas development comes at a good time for ADG as we build on our existing services to the oil and gas industries.

With renewed growth and resource development there is always a need for new and improved infrastructure.

In order to benefit from this infrastructure spending, we recently signed an agreement to represent leading horizontal directional drilling brand, Universal HDD in Australian and New Zealand markets.

Taking into account all these positive factors, we believe that future prospects for business in general and ADG in particular are looking most encouraging.

Until next time, stay positive.

ADG signs exclusive distribution agreement

Now - a versatile and competitively priced horizontal directional drilling solution

ADG Global Supply has secured the exclusive rights to distribute Universal horizontal directional drilling equipment from the stable of one of the world's best known names in drilling - Robbins HDD LLC.

The distribution agreement is for sales of Universal HDD drill rigs and related trenchless drilling equipment in Australia and New Zealand.

Extensive options

Universal HDD has gained a worldwide reputation for supplying competitively priced, customised horizontal directional drills which come with an extensive range of options, features and upgrades.

ADG's team is looking forward to introducing the Universal HDD range to our drilling customers around Australia and New Zealand in the knowledge that with this extensive range of drill rigs and equipment there is a solution to every trenchless drilling need.

ADG has already sold over \$2 million worth of Universal equipment and we expect further sales in the near future.

The Universal HDD range includes three classes of machines - short, mid and long range. It also includes a broad range of tools and accessories.

All HDD machines are designed to deliver versatility and operator comfort and are powered by high performance John Deere engines.

The smooth response hydraulic system gives a level of control demanded by the user in any application from drilling in sand to rocky soil. It features increased torque and rotating power, allowing the operator to pull more material and get more done.

Compact in design, the rugged machines are made for maximum manoeuvrability in confined spaces.

Featuring an ergonomic layout, the controls and layout of the cabin are designed to make it easy to operate.

Among the accessories and tools available with the Universal HDD are locating systems, buckets, reamers, mixers, tanks, drill pipes and bits, and drilling fluids. **Continued page 2**

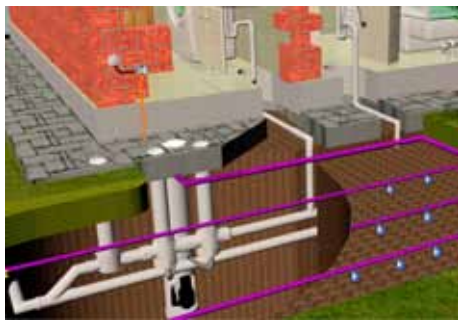

At last - Universal Pumps' extended grey water product range = innovation

With the increasing emphasis on grey water use, including the introduction of complying legislation in a number of states, Universal Pumps has announced a major expansion of its GreyFlow grey water systems.

GreyFlow systems have been developed over the past seven years and allow families to reuse water from the shower, bath, laundry and washing machine to water their gardens.

While demand for grey water systems has been strongest in areas where legislation is in place, more and more environmentally

Potential Water Savings

Up to 200,000 litres a year with an average of 120,000 for a 3 person household. (100L/P/Day)

conscious homeowners are choosing to voluntarily install grey water recycling systems in their homes.

Also, in states such as Victoria, where sprinkler use is banned, homeowners don't have a choice. Recycled grey water is the only way in which they can maintain a healthy green garden while avoiding wastage of some 93 litres per person per day.

GreyFlow has a core range incorporating three different systems. Each of these systems comes with options that are selected according to the environment and a family's requirements.

The BG and PS systems are designed for below ground installation whilst the AG series is installed above ground. All GreyFlow systems are whole of house kits and are capable of up to six stations. They deliver even and efficient water over a large area using sub-surface drip irrigation.

Universal GreyFlow grey water systems are specifically designed for easy installation and low maintenance.

With the AG and BG Series, the grey water is directly diverted to a garden with no intermediate storage tank, eliminating the need for a holding tank which can

sometimes cause odours and mosquito breeding to occur.

Some areas of QLD have specific legislation stating that no grey water is to be held on the property - making GreyFlow an ideal solution.

How to make a home grey ready

Originally introduced to satisfy requirements in NSW and QLD for new homes to be grey water ready, the GreyFlow PS Series features a simple interceptor.

It is designed for builders who need to fulfill legal requirements to make new homes 'grey water ready'.

This is a base component installed during construction of the home which can later be fitted with the remaining components to complete the grey water system.

Self cleaning option means low maintenance

GreyFlow systems also come with a self cleaning option. Universal Pumps' systems use air for cleaning, more than halving water loss during the cleaning process. Self cleaning is increasingly becoming the preferred choice because it means less maintenance.

System components

Universal Pumps looks forward to introducing the GreyFlow systems to the market and showing customers the real benefits that will be experienced with this innovative technology. All GreyFlow systems are watermarked and come with a 1 year warranty.

To find out more, contact your Universal Pumps account manager.

Now - a versatile and competitively priced horizontal directional drilling solution, exclusive to ADG

The terms HDD and trenchless drilling are used to describe the installation, repair and replacement of underground piping infrastructure without the need for any significant surface excavation.

HDD technology is used in applications such as gas and oil pipelines, coal seam/coal bed methane gas pipelines and piping for telecommunications, water, wastewater and sewage, electricity, environmental protection and remediation.

For more information on Universal HDD rigs and equipment please contact Paul Johnson on 0439 204 063.

Marc and Darren take on a legend

ADG's Marc and Darren didn't hesitate at all when asked to name the highlight of their recent business development trip to West Africa. Both immediately recalled their meeting with one of the legends of world boxing, Azumah Nelson.

Not too sure about who he is or what he achieved? Well, how's this for a record - WBC Featherweight Champion (1984-1988), WBC Super Featherweight Champion (1988-1994) and WBC Super Featherweight Champion (1995-1997). That's more than 12 years at the top of the tree in a sport that can be rather rough on the body.

Now aged 51, the former champ was only too willing to share some of his memories with Marc (left) and Darren during their brief but memorable meeting.

Always something new out of Africa

Always something new out of Africa.

ADG's Marc and Darren had good reason to recall this saying as they adjusted to often unfamiliar local procedures and conditions during their recent visit to West Africa.

As can be seen some things are very different in Africa, like having to make it up an incline on a slippery muddy road without losing your load and/or truck, and having to get your truck manually offloaded box by box.

At the end of the day though there was something equally unexpected but a lot more welcome - a pool in which to wash off the day's toil.

By the way, the saying originally came from Roman writer Pliny the Elder. While he was talking about Africa's animals, his expression assumed a more general meaning of Africa as a mysterious continent when it first came into widespread use in the 16th Century.

DID YOU KNOW?

There is no doubt that Australia is a big country with big ideas.

Australians were involved in the invention of notepads, the surf lifesaving reel, aspirin, the pacemaker, penicillin, the Hills Hoist clothesline, the plastic disposable syringe, the wine cask, the bionic ear, escape slides for evacuating aircraft, the dual-flush toilet, anti-counterfeiting technology for banknotes and long-wearing contact lenses.

If you know of other similar high profile inventions by Australians, why not let us know and we will gladly publish them.

More than just earth moving tyres

Junior, mid-tier mining companies who operate without the benefit of tyre allocations from major suppliers, now have a way of getting the tyres they need rapidly and at highly competitive prices.

This follows the transformation of ADG's tyre procurement service into a fully blown tyre supply division under the leadership of recently appointed tyre manager, Chris Batten - a man with considerable experience in managing tyres for multinational companies.

According to Chris, junior miners will no longer have to go through the time consuming and often costly process of sourcing and transporting their own tyres.

By ordering through ADG they can enjoy the cost benefits of ADG's bulk buying power and well established supply sources.

With a big supply of tyres warehoused, ADG can supply most tyres rapidly.

While junior miners are expected to be the main beneficiaries of ADG's expanded service, the company will also continue to meet peak demand from larger miners as well as the ongoing demand for difficult-to-access tyres.

ADG does not charge a premium for accessing tyres currently in short supply.

In its goal of becoming a one stop supplier of all tyre-related requirements, ADG recently concluded an agreement with Haltech to distribute its tyre and wheel accessories locally.

It is also currently finalising arrangements for the supply of tyre shop tooling.

Email Chris Batten for further details batten@adgglobalsupply.com

Universal Pumps introduces a fire fighting range

Universal Pumps has broadened its pump range to include a new innovative series of Fire Fighters designed to pump water at high volumes and with the benefit of easy manoeuvrability - properties essential when faced with nature's fury.

Universal Pumps offers an unbeatable affordability/quality combination and this stands true for the new Fire Fighter Range.

The introductory range features a motorised Universal Fire Fighter pump - designed to achieve a flow rate of 335 litres/min. It also includes the smaller Water Transfer Pump with a flow rate of 134 litres/min. An expanded range is due for release early in 2010.

The Fire Fighter pumps come complete with a trolley to allow for easy manoeuvring - vitally important when taking into consideration the environment in which these pumps are used.

Talk to your account manager to place your order today.

ADG Procurement team - more than just purchasing

Identifying and counting 2000 lines of stock and relocating it to a warehouse some 500km away can be a daunting task, particularly when this has to be accomplished in a remote location without some of today's efficiency aids.

This was exactly what ADG Global Supply was recently asked to do by a client.

In brief, the project involved identifying and counting the stock in a workshop warehouse, safety store, light vehicle store and a workshop at another site. This was followed by the labelling and packing of the parts, resolving stock and receiving all the stock into its new location in Perth.

At ADG Global Supply we place emphasis on spending time on site with our clients, studying your processes (and pain!). Your inventory system is a crucial part of operations and if its right, the rest of the procurement process is made much more efficient.

Give us a call and one of our experienced procurement professionals will visit your site, conduct an evaluation on processes and inventory and understand your unique situation.

Your assigned procurement professional will then develop a specific strategy for your situation, ranging from tighter inventory control or min/max. monitoring of critical items, to a complete procurement solution.

Give Andrew Barnes a call on +61 8 9249 7599 to take up this offer.
